

Sistrade® Print in a Letter Press company

Founded in 1996, EIKON – Centro Gráfico, S.A. is already one of the most respected printing companies specialized in producing self-adhesive labels. This project came from Eikon’s need to acquired an integrated management system focused on the letter press industry. Sistrade® Print is an ERP developed by SISTRADE in Web, based on the most recent information technologies, such as the use of Microsoft SQL Server. Specialized in the label printing area, Sistrade® Print is able to estimate several types of works. Is a fully customisable application, becoming more flexible and functional.

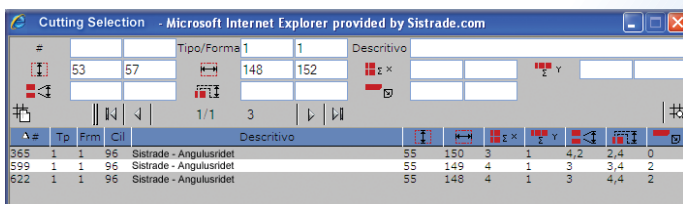

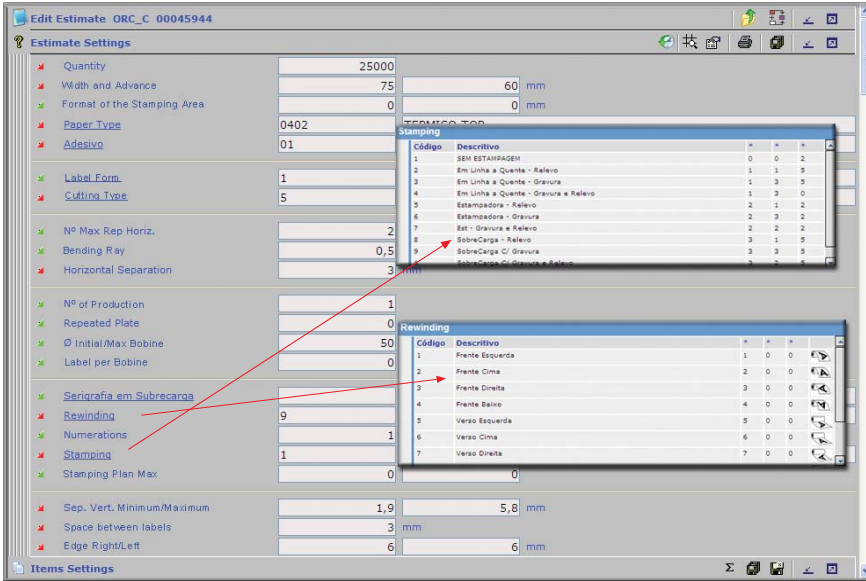

Imposition and Cutting Plan

There are specialized customisations for labels estimates, which are: third parties maintenance and cutting files maintenance. Besides the introduction of the customer’s data, the third parties maintenance, allows introducing default values for the estimates, such as, the reel format, the number of labels by reel, the type of rewinding (e.g. front, right, back right, etc.) and the customers comments.

In the maintenance of cutting files, the estimator is able to attribute to each customer a type of cutting. To do so, is possible to introduce the label’s width and height by default, the labels distribution, the spaces between labels, etc.

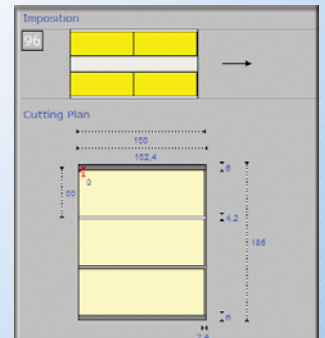

With Sistrade® Print Labels, the estimator is able to edit an estimate from anywhere in the world. A few general data are inherited from the estimate's bid register. Being so, he will only have to introduce the paper's gramage, the label's shape, the amount of labels by reel, the type of cutting, the type of rewinding, the stamping, the space between labels, etc.

By selecting the required machine, Sistrade® Print calculates the best imposition and the cutting according to the type of work and machine to be used. Beyond that, the application automatically calculates the printing and stamping cylinders, the plate and cutting's shape, the space between labels, among others.

In the stamping by sub charge option, Sistrade® Print automatically calculates the stamping imposition, as well as the revolution values, time/costs, stamping film, number of reels, the reel diameter, etc.

After elaborating and approving the estimate, the estimator is able to manage the rubric numbering, through this option.
